Q11

Aim:- To write a python program for creating and updating student registration details txt file operations.

Algorithm:-

- Step 1:- Start
- Step 2:- Using open() method, Create and write txt file "my.txt" with student details.
- Step 3:- Update the new registered student details using append operation it.
- Step 4:- Open the file in read mode and using read() method print the student details.
- Step 5:- Using seek method print the particular record.
- Step 6:- Using tell method print the current position file
- Step 7:- Close the file
- Step 8:- Stop.

PROGRAM:-

```

file = open("student1.txt", "w")
input 1 = input("Enter column names\n")
file.write(input 1)
file.write("\n")
n = int(input("Enter the no of students"))
for i in range (0, n):
    input 2 = input("Enter student details with for new")
    file.write(input 2)
    file.write("\n")

file = open("student.txt", "a")
input 3 = input("Enter updated students details\n")
file.write(input 3)
    
```

Output

Student details using Read function

VTU NO	NAME	AGE
--------	------	-----

2305	RAM	
------	-----	--

1920	SIVA	
------	------	--

2305	RAM	
------	-----	--

1920	SHIVA	
------	-------	--

The length of first line is

15

Output of Readline function

2305 RAM 20

find the current position of file pointer

29

```
file = open("Student 1.txt", "r")  
print("Student Details using Read function is:")  
print(file.read())  
print("\n")  
  
file.seek(0)  
print("The length of first line is:")  
line = file.readline()  
len = len(line)  
print(len)  
file.seek(len+1)  
print("Output of Reading (first student record) find is:")  
print(file.readline())  
  
print("\n find the current position of file pointer:")  
file.tell()  
print(f)  
file.close()
```

Result: Thus, the python program for creating and updating student registration details using file operations was executed successfully.

Task 2

Aim: To write a function that counts the no. of lines containing word "ERROR".

Algorithm:

1. Initialize Error Counter:
 - Define the function `count_error_lines`
 - Initialize `error_count` to 0.
2. Open and Read file
 - Open the file specified by filename in read mode using a `with` statement.
3. Check Each Line for "ERROR":
 - Loop through each line in file.
 - If the line contains word "ERROR" increment error.
4. Return Error Count:
 - After reading all the lines return value of `error_count`.
5. Execute the program:
 - Call `count_error_lines("log.txt")` to count the no. of lines with the Error.

Program

```
def count_error_lines(filename):  
    error_count = 0  
    with open(filename, 'r') as file:  
        for line in file:  
            if "ERROR" in line:  
                error_count += 1  
    return error_count  
  
error_lines = count_error_lines("log.txt")  
print(f"Number of lines with 'ERROR': {error_lines}")
```

log.txt

Error object are thrown when running Error occur

Result: Thus to write a function that counts the no. of lines containing word "ERROR" is verified successfully.

(1) "v" is not a variable
(2) "v" is not a variable
(3) "v" is not a variable
(4) "v" is not a variable

Output

Number of lines with 'ERROR' is 2

(1) "v" is not a variable
(2) "v" is not a variable
(3) "v" is not a variable
(4) "v" is not a variable

(1) "v" is not a variable
(2) "v" is not a variable
(3) "v" is not a variable
(4) "v" is not a variable

(1) "v" is not a variable

(2) "v" is not a variable

(3) "v" is not a variable
